

Introduction to Algebra

Prepared by Nikolas Agisilaou

Variables & Constants

Letters represent unknown or changing values.

- **Variable:** A letter for an unknown (x , n , y).
- **Constant:** A fixed number (e.g. the 7 in $3x + 7$).
- **Coefficient:** The number before a variable (e.g. the 5 in $5x$).
- **Term:** A single piece separated by $+$ or $-$ signs.

Algebraic Conventions

Rules everyone agrees to follow:

- $3 \times x \rightarrow 3x$ (drop the $\times$ sign)
- $x \times x \rightarrow x^2$ (use index notation)
- $1x \rightarrow x$ and $-1x \rightarrow -x$
- Number before letter: $2a$ not $a2$
- Letters in alphabetical order: abc not cab
- $x \div 4 \rightarrow \frac{x}{4}$

Words $\rightarrow$ Algebra: Key Vocabulary

Operation	Keywords
$+$	sum, total, more than, increase
$-$	difference, less than, decrease
$\times$	product, times, double, triple, of
$\div$	quotient, share, split, half, per
x^n	squared, cubed, to the power of

Watch the order with subtraction!

- "7 less than n " = $n - 7$, **NOT** $7 - n$
- " n subtracted from 20" = $20 - n$
- "Quadruple n , subtract 3" = $4n - 3$
- "A third of n , add 8" = $\frac{n}{3} + 8$

Substitution

Replace the letter with its value **in brackets**, then use BIDMAS.

- If $a = 5$, $b = -3$: $a^2 - 2b = (5)^2 - 2(-3) = 25 + 6 = 31$
- **Negative trap:** $(-4)^2 = 16$ but $-4^2 = -(4^2) = -16$
- **Always bracket negatives** to avoid squaring errors!

Simplifying: Like Terms

Only combine terms with the **same variable and same power**.

- $5x + 3x = 8x$ ✓
- $5x + 3x^2 \neq 8x^3$ ✗
- $pq = qp$ (order doesn't matter)
- Remember: x means $1x$

Multiplying & Dividing Terms

Multiply: coefficients $\times$ coefficients, then add powers.

$$4a \times 5b = 20ab$$

$$3x \times 7x = 21x^2$$

Divide: coefficients $\div$ coefficients, then subtract powers.

$$18x^2y \div 6xy = 3x$$

Forming Expressions from Problems

Steps:

1. Identify the unknown $\rightarrow$ assign a letter
2. Translate each relationship into algebra
3. Simplify where possible
4. Check with a test value

Common setups:

- Width = w , Length = $2w - 3$
- Perimeter = $2(\text{length} + \text{width})$
- Area = length $\times$ width
- Patterns: find common difference d , then $dn + c$

Expression vs Equation vs Identity vs Formula

Type	Key Feature	Example
Expression	No equals sign	$8k - 3m + 2$
Equation	True for <i>specific</i> values	$7(x + 2) = 35$
Identity	True for <i>all</i> values ($\equiv$)	$5(a - 1) \equiv 5a - 5$
Formula	Relates variables; has a subject	$V = \frac{1}{3}\pi r^2 h$

Exam tip: No equals sign $\Rightarrow$ it **cannot** be an equation, identity, or formula!

Quick Exam Shortcuts

Keyword spotting: "Write an expression for..." $\rightarrow$ form algebra. "Evaluate / find the value" $\rightarrow$ substitute. "Simplify" $\rightarrow$ collect like terms. "Find the n th term" $\rightarrow$ general expression in n .

Checking trick: Substitute a simple value (e.g. $x = 2$) into both your answer and the original to verify they match.

Consecutive even numbers: $2n, 2n + 2, 2n + 4$. **Consecutive odd:** $2n + 1, 2n + 3, 2n + 5$.
